

QuickRide Capstone

SQL SNACKS

semicolon

The Situation

You did well in your first week, so Chidi has handed you the whole analytics job for QuickRide's quarterly review. The company has grown: there is now a riders table alongside drivers and trips, and the trips table links to both by id. Every question below is a real ask for the review. Turn each one into SQL and run it.

Load the database first. Run the whole `quickride_plus.sql` file in MySQL, then `USE quickride_plus;` Because the answers now live across three tables, most questions will need a JOIN, a subquery, or a UNION.

semicolon _____

What is in the data (1 of 2)

riders

Column	What it holds
<code>rider_id</code>	Unique id for the rider
<code>rider_name</code>	Passenger's name
<code>city</code>	City the rider is based in
<code>plan</code>	Basic or Premium
<code>signup_date</code>	When they joined

semicolon _____

What is in the data (2 of 2)

drivers

Column	What it holds
driver_id	Unique id for the driver
driver_name	Driver's name
home_city	City the driver is based in
vehicle_type	Bike, Economy, Comfort or XL
join_date	When they joined

semicolon

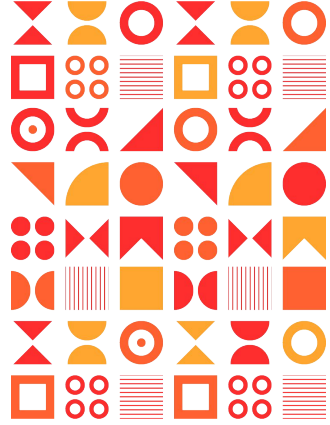

What is in the data (2 of 2)

trips

Column	What it holds
trip_id	Unique id for the trip
rider_id	Which rider took it (links to riders)
driver_id	Which driver did it (links to drivers)
city	City the trip happened in
trip_date	Date of the trip
distance_km / duration_min	How far / how long
fare	What was paid, in naira
payment_method	Card, Cash or Wallet
rating	1 to 5, blank if not rated
status	Completed or Cancelled

semicolon

Reminder: cancelled trips have a fare of 0 and no rating,
so filter to completed trips whenever a question is about
money or performance.

semicolon _____

The review questions (1 of 4)

Working across tables (joins)

Q1. *“For the report I need every completed trip showing the rider's name, the driver's name, the city and the fare. The trips table only keeps ids, so bring in the actual names.”*

Q2. *“Pull all our Lagos trips, showing the rider, the driver, the vehicle type and the fare.”*

semicolon

The review questions (2 of 4)

The numbers behind people (joins with grouping)

Q3. *“Who are our most valuable riders? Total spend per rider on completed trips, biggest spender first.”*

Q4. *“For the driver scorecard: for each driver, how many completed trips they did and their average rating.”*

semicolon _____

The review questions (3 of 4)

Questions with a question inside (subqueries)

Q5. *“Show me the trips that cost more than our average fare. I want to see the premium rides.”*

Q6. *“For a reliability badge, which drivers have never had a single cancelled trip?”*

Q7. *“Marketing wants to feature our biggest ride ever. Which rider took the most expensive trip of all?”*

Q8. *“Chioma Bello is our benchmark regular rider. Which riders have taken more trips than she has?”*

Q9. *“We want to thank our happy riders. Which riders have given us at least one 5-star trip?”*

semicolon

The review questions (4 of 4)

Combining lists (unions)

Q10. *“Investors want one combined contact list of everyone in the system: riders and drivers together, each with their name, their city, and whether they are a Rider or a Driver.”*

Q11. *“Give me one clean list of every city we touch, whether a trip happened there or a driver is based there. No duplicates.”*

semicolon _____

Challenge

Q12. *“Which single driver has earned us the most money in total, and how much? I only want the top earner.”*

semicolon

Push one file with your **12 queries** to your repository, each labelled Q1 to Q12. Then finish with a short paragraph: pick any two of your findings and say, in plain language, what QuickRide should actually do about them. Turning data into a decision is the real job.

Please submit the final document before 8:00 AM on Friday,
September 4th, 2026.

Enjoy 🙌
